CERTIFICATE

THE ASSIGNMENT ENTERED IN THIS REPORT HAVE BEEN
SATISFACTORILY PERFORMED BY

Registration No :25BCY10120
Name of Student :TULSI SHARMA
Course Name : Introduction to Problem Solving and Programming
Course Code : CSE1021
School Name : SCAI
Slot : B11+B12+B13
Class ID : BL2025260100796
Semester : FALL 2025/26

Course Faculty Name : Dr. Hemraj S. Lamkuche

Signature:tulsi

Practical No: 1

Date: 9NOVEMBER

TITLE: Write a function count_distinct_prime_factors(n) that returns how many unique prime factors a number has.

AIM/OBJECTIVE(s): To define a function which can calculate the different prime factors of a number.

METHODOLOGY & TOOL USED: If after dividing a number we get zero will take it in set of factors and then print it.

BRIEF DESCRIPTION: If after dividing a number we get zero will take it in set of factors and then print it. After that we will add one in the i and will keep going, also will calculate the execution time and memory usage.

RESULTS ACHIEVED:

code:

```
import time
```

```
import sys
```

```
import math
```

```
def distinct_prime_factors(n):
```

```
    factors = set()
```

```
i = 2  
while i * i <= n:  
    while n % i == 0:  
        factors.add(i)  
        n /= i  
    i += 1  
if n > 1:  
    factors.add(n)  
return factors
```

```
number = int(input("Enter a number: "))
```

```
start_time = time.time()  
factors = distinct_prime_factors(number)  
end_time = time.time()
```

```
print(f"\nThe number {number} has {len(factors)} distinct prime factors:  
{factors}")  
print(f"Execution time: {end_time - start_time:.6f} seconds")  
print(f"Memory utilization: {sys.getsizeof(factors)} bytes")
```

DIFFICULTY FACED BY STUDENT: made mistakes in first few trys due to the range of n.

SKILLS ACHIEVED: Now i can calculate a number prime factors using python.

Practical No: 2
